

Melon API & Dashboard

Partner Onboarding Overview

1. API Overview

Introduction

Welcome to the Melon API documentation. The Melon API allows partners to programmatically manage identity verification, KYC (Know Your Customer), and seamless customer onboarding for customers in Nigeria.

Key Features

- **Customer Verification:** Easily capture basic customer details and seamlessly initiate verification workflows.
- **Address Verification:** Streamline physical address verification with Melon's agent network.
- **Webhooks:** Receive real-time updates for verification status changes.
- **API Keys:** Securely manage access across multiple environments (Live and Sandbox).

Environments

Melon provides two environments:

1. **Sandbox:** Used for testing and integration. Mock responses are returned and no real data is processed.
2. **Live:** Production environment where real identity verifications are processed and billed.

API keys and environment toggles are managed from the [Melon Dashboard](#).

2. Web Dashboard Overview

The Melon Web Dashboard is the organization's central hub for managing field operations, tracking impact metrics, and overseeing verification processes.

Getting Started

Upon logging in, users land on the Overview page, which provides a high-level summary of the organization's performance and recent activity.

Key Metrics (shown on the Overview page)

Metric	Description
Total Requests	The total number of jobs / verifications submitted.
Completed / Approved	The number of successfully verified and approved jobs.
Pending / In Review	Jobs currently awaiting field agent action or admin review.
Rejected	Jobs that failed verification or did not meet onboarding criteria.

Navigation Sidebar

The left sidebar allows navigation between the following modules:

- **Overview:** High-level statistics and insights.
- **KYC:** Manage Know Your Customer verifications and approvals.
- **Reports:** Build survey forms and view field data submissions.
- **Impact Metrics:** Track the organization's social and operational impact.
- **Portfolio:** Manage projects, beneficiaries, and investments.
- **Map View:** Visualize activities and field agents geographically.
- **Settings:** Configure webhooks, API keys, and organizational preferences.

User Profile & Organization

Account settings and organization details can be managed by clicking the profile avatar in the bottom-left corner, or by navigating to the Settings page. From there, users can view their active subscription plan, invite team members, and configure platform-wide preferences.

3. Further Resources

The following pages from the Melon documentation contain additional detail and may be useful for deeper technical onboarding:

- **Quickstart Guide:** Get up and running with the Melon API in minutes.
- **Authentication:** How to authenticate API requests.
- **KYC API Reference:** Full reference for KYC-related endpoints.
- **Webhook Events:** Details on event types and payloads for webhooks.
- **Error Codes:** Reference list of API error codes.
- **Rate Limits:** API request limits and quotas based on pricing plan.
- **KYC Management (Dashboard):** How to create, manage, and review KYC verification requests.

4. Operational Guidelines for Successful Implementation

To ensure a smooth field verification process and a positive experience for your team, Melon, and the field agents, the following operational guidelines should be adhered to throughout the engagement:

Timely Review and Approval of Submitted Jobs

When jobs submitted by field agents are marked as **"Pending Approval,"** Your review team should endeavour to review and make a decision within **48 hours**.

Timely approval is important because:

- It enables agents to receive their payments promptly.
- It reduces uncertainty and frustration among field agents.
- It allows Melon to maintain an active and reliable agent network.
- It ensures that rejected jobs can be corrected or investigated quickly where necessary.

Where a submission requires further clarification, the reason for the delay or additional information required should be communicated to the Melon team as soon as possible.

Job Review and Approval Outcomes

Following the completion of a verification job, Your team will review the information and evidence submitted by the field agent and assign one of the following outcomes. The outcome will determine both the status of the verification and whether the field agent is eligible for payment.

1. Approve

The verification has been completed satisfactorily, and the information, evidence, and field observations provided are sufficient to support your decision to proceed with the customer.

An **Approved** job means:

- The verification requirements have been adequately fulfilled.
- The information and evidence submitted are satisfactory.
- There is a high level of confidence in proceeding with the customer.
- **The field agent is eligible for payment.**

2. Not Approved

The verification has been completed and the required information has been collected; however, the findings, field observations, or notes provided do not give your team sufficient confidence to proceed with the customer.

A **Not Approved** job means:

- The verification exercise was conducted and the required field activity was completed.
- The information submitted is valid and reflects the agent's findings.
- However, the findings do not provide sufficient justification or confidence for you to proceed with the customer.
- **The field agent is still eligible for payment**, provided the verification was conducted in accordance with the agreed requirements.

3. Reject

The verification submission does not meet the agreed quality or verification requirements. This may occur where the job was completed inadequately, the required evidence was not provided, the information submitted is materially incomplete or unreliable, or the verification process was not followed appropriately.

A **Rejected** job means:

- The verification was not conducted to the required standard.
- The evidence or information provided is insufficient or unreliable.
- The field agent did not adequately follow the agreed verification process.

- The field agent is not eligible for payment.

Important Distinction Between “Not Approved” and “Reject”

The distinction between these two outcomes is important:

Not Approved = The job was properly completed, but your assessment of the customer does not support proceeding. The agent is paid.

Reject = The job itself was not completed to the required verification standard. The agent is not paid.

This distinction ensures that field agents are not penalised for accurately reporting findings that may ultimately result in your team deciding not to proceed with a customer. Payment is linked to the **quality and proper completion of the verification assignment**, rather than whether the customer ultimately meets your risk or onboarding criteria.

2. Accurate and Complete Job Information

The Risk team should ensure that all information provided when creating jobs is accurate, complete, and sufficiently detailed for the field team to locate and execute the assignment successfully.

At a minimum, each job should contain:

- Full and accurate address or location description.
- Name of the individual, business, or organisation to be verified.
- Relevant phone number or contact information where applicable.
- Any useful landmarks or additional directions.
- Type of verification required.
- Specific information or evidence the field agent is expected to collect.
- Any special instructions or access requirements.
- Required photographs, documents, or other evidence.

The quality of information provided at job creation directly affects the field agent’s ability to complete the assignment efficiently and can significantly reduce failed visits, repeated trips, and unnecessary verification costs.

3. Feedback on Rejected Submissions

Where a job is rejected, the team should provide a clear and specific rejection reason rather than a generic rejection.

This will allow Melon to:

- Review the submission with the agent.
- Correct recurring errors.
- Improve agent training.
- Identify unclear verification requirements.
- Reduce repeated rejection of similar submissions.

Where appropriate, Melon may request clarification or conduct an internal quality review before the agent is asked to revisit a location.

4. Field Agent Communication and Escalation

A clear escalation channel should be maintained between your team and Melon teams for issues arising during field operations.

Issues that should be escalated include:

- Incorrect or incomplete addresses.
- Inaccessible locations.
- Customer refusal to participate.
- Duplicate jobs.
- Safety or access concerns.
- Technical challenges with the Melon platform.
- Questions regarding verification requirements.
- Jobs that cannot reasonably be completed within the expected timeframe.

The agreed Melon points of contact should be used for operational escalations to ensure issues are resolved quickly.

5. Data Quality and Evidence Standards

All parties should work towards maintaining a high standard of data quality throughout the verification process.

Melon will support this through platform-level validation, GPS/location checks, agent monitoring, quality assurance processes, and review of submitted evidence.

Your team should ensure that the verification requirements and acceptance criteria are sufficiently clear to enable agents to collect the correct information from the outset.
